DESCRIPTORS: Swine, *Influenza viruses, *Tissue culture, Embryos, Cattle, Kidneys, Culture media.

Swine influenza virus can proliferate in a tissue culture of cattle embryonic kidney, which is equal in its sensitivity to this virus to chick embryos. The presence of swine influenza virus in a tissue culture may be determined by its cytopathogenic action, by hemagglutination, or by hemadsorption. The most sensitive method of indication of virus in tissue culture is the hemadsorption reaction. (Author)

DESCRIPTORS: *Inhalation immunization, *Sheep Aerosols, *Brucellosis, Veterinary medicine.

The aerosol method of immunication of sheep against brucellosis with the vaccine from strain 19 in a dose of 15-30 billion microbe bodies is harmless to the sheep. Serological reactions were manifest in animals in 15-20 days after aerosol vaccination. Intensity and duration of immunity in group aerosol vaccination equals the immunity, formed by subcutaneous inoculations. (Agriculture--Animal Husbandry, TT, v. 11, no. 6) (over)

DESCRIPTORS: Diagnosis, *Anthrax, Ethers, Anesthesia, Veterinary medicine.

In order to speed up the diagnosis of anthrax for the biological test, it is expedient to utilize guinea pigs, which underwent a double reaction of the ether anesthesia; at such a time the period of research is reduced to three-six hours. Bacteriological diagnosis of anthrax can be speeded up by means of examination of the specimen obtained through puncture from the place of secretion of suspicious material, or of a regional lymph node of the guinea pig, utilized as a biological specimen.
